

ABU ENEJOH CHRISTOPHER

Senior Software Engineer · Fintech, Payments & Core Banking

Ibadan, Nigeria (UTC+1, full working-day overlap with UK & EU) | chrisenejohabu@gmail.com | +234 806 724 2034 | [linkedin.com/in/abu-enejoh-b2954150](https://www.linkedin.com/in/abu-enejoh-b2954150) | github.com/enejoh1

PROFILE

Backend engineer with 9+ years building and operating financial systems in production: core banking, payments and regulated fintech products used daily by Nigerian cooperative societies and mortgage customers. Works primarily in Laravel and PHP with Flutter on the client, and owns services end to end: API design, database performance, integrations with payment and identity providers, and the incident response that keeps money moving. Leads engineering for an FCCPC-licensed B2B banking platform, holding final say on architecture and technology choices while staying hands-on in the codebase, so brings judgement about uptime, cost and regulatory risk alongside delivery. Based on UTC+1 with full working-day overlap with European and UK teams.

TECHNICAL SKILLS

Languages PHP, Go, Java, Kotlin, Python, SQL

Backend Laravel (10 to 13), REST API design, webhooks, third-party payment & identity integrations

Data PostgreSQL, MySQL, query optimisation & indexing, operational reporting, BI dashboards

Cloud & Ops AWS, Azure, Linux administration, monitoring & alerting, backup and disaster recovery, incident response

AI & Tooling Claude (advanced proficiency), used daily in production development for code generation, refactoring, debugging and technical documentation across Laravel and Flutter codebases; conversational assistant backend integration

Domain Core banking, savings & loan ledgers, POS / terminal management, BVN & KYC identity verification, FCCPC regulatory compliance, PCI-sensitive data handling

Leadership Engineering team leadership, technical strategy & architecture ownership, code review and mentoring, technical hiring, vendor selection and integration partnerships, regulatory liaison, delivery planning with executive stakeholders

EXPERIENCE

Senior Software Engineer

2023 – Present

Coopvest Limited · Coopmoni and CoopZone · Nigeria

- One of three principal engineers on Coopmoni, a licensed digital banking product: a Laravel 10 / PHP 8.1 backend on AWS spanning 45 domain models and 145 migrations, serving a Flutter mobile app now at build 69 on the Play Store.
- Lead engineering delivery with final say on architecture and technology choices: set technical direction, run code review and mentoring, own technical hiring, and plan delivery with the executive team.
- Built the referral programme end to end and single-handedly: referral code generation with backfill across the existing user base, a bonus payout service, milestone tracking and a permissioned referrals dashboard.
- Delivered the loan lifecycle alongside two engineers, personally owning disbursement confirmation and reversal, 30-day settlement, offline repayment reconciliation, loan tracking and upgrades, and an automated email and SMS repayment reminder system across the active loan book.
- Sourced and established the Prembly identity-verification partnership, taking it from first approach through commercial terms to production, then integrated it alongside Adjutor behind a switchable provider interface so a single vendor outage no longer blocks customer onboarding.
- Built Natal Savings, a targeted savings product with top-up, withdrawal and permissioned access, on top of the platform’s existing savings service.
- Built the Wema Bank virtual account integration end to end: account provisioning, the inbound transaction webhook, mini-statement retrieval and encrypted partner request handling, giving each member a dedicated account number for collections.
- Integrated PalmPay CBN codes, Polaris transfer webhooks and Termii OTP delivery, and extended HorizonPay agent banking with agent sorting and cashout charge logic.
- Implemented general-ledger transfers, the 30-day account maintenance fee engine, Excel and PDF account statements, and last-login security tracking, all under role-based permissions with full activity-log audit trails.

Software Engineer

Feb 2021 – Present

Cooperative Mortgage Bank · Ibadan, Nigeria

- Designed and shipped a BVN verification portal for the bank’s compliance team, wrapping Prembly IdentityPass behind a server-side proxy so the live secret key never reaches the browser, and rendering each lookup as a verification credential including the customer’s passport photograph.

- Wrote its rate limiter from scratch for an environment with no Redis or database available: a file-backed sliding window guarded by flock for concurrency safety, keyed on hashed rather than raw IP addresses, self-pruning so the store cannot grow unbounded, and deliberately fail-closed so a broken counter blocks lookups instead of silently leaking paid identity credits.
- Hardened the deployment end to end: bcrypt-gated access that refuses to boot without a configured hash, secrets held above the web root, per-directory access denial and an append-only audit log of every lookup, on the principle that each call returns a real person's name, date of birth, address and photograph.
- Built the bank's staff training platform single-handedly on Laravel 13 and PHP 8.3: 14 domain models spanning departments, courses, lessons, enrolments and assessments, with a timed auto-scored assessment engine supporting attempt limits, pass marks and question shuffling.
- Wired training outcomes into HR performance appraisal, awarding a scored entry per staff member and course against a named appraisal period, with an export trail recording who exported which figures and when, under role-based access and append-only audit logging.
- Own production incident response: diagnosis, hotfix and post-mortem, with regular service updates to product owners and operations leadership.

Independent Software Engineer

Apr 2017 – Feb 2021

Self-employed · Nigeria

- Delivered backend and mobile systems on contract across fintech and commerce, working as sole engineer or technical lead and owning each build from requirements through to deployment and support.
- Built and released games in Unity and C#, covering gameplay systems, physics and interface work, taken on deliberately to widen my range beyond line-of-business software.
- Ran a buy-and-sell trading business alongside the client work, owning sourcing, pricing, margin and customer relationships end to end, which is where the commercial instinct behind later vendor and partnership work came from.

System Administrator & Support Engineer

Oct 2013 – Apr 2017

Edgebase Technologies · Lagos, Nigeria

- Deployed and commissioned physical server hardware end to end: rack installation, RAID array configuration, firmware and capacity upgrades, and disk replacement with array rebuilds carried out to keep services available.
- Acted as the escalation point for system and hardware faults, owning triage, diagnostics and root-cause analysis through to resolution and follow-up, then translating findings into plain language for non-technical staff.
- Ran continuous monitoring and log analysis to catch anomalies before they became outages, and owned backup and disaster-recovery procedures with restores tested rather than assumed.
- Trained and onboarded staff on secure systems use, cutting repeat user-error incidents and the support load that came with them.

SELECTED PROJECTS

CMB Learning Management System · *Staff training & appraisal platform · Cooperative Mortgage Bank*

Courses, lessons and timed assessments feeding a per-period training score that HR exports into performance appraisal. Departmental org structure, role-based separation of learner and administrator capability, append-only audit logging and an automated test suite. Built solo, frontend included. **Stack:** Laravel 13 · PHP 8.3 · Tailwind · Vite · *private repo*

Coopmoni · *Licensed digital banking platform · Coopvest Limited*

Coopvest's digital banking product: a Laravel 10 backend on AWS driving a Flutter client (257 Dart files, clean architecture with Riverpod, get_it and go_router). Ships loans, savings, referrals, agent banking and virtual accounts. Live on the Play Store as ng.coopvest.coopmoni at version 2.5.0 build 69. I own the referral system, large parts of the loan lifecycle, and the identity and payment integrations. **Stack:** Flutter · Dart · Laravel 10 · PHP 8.1 · MySQL · *private repo*

CoopZone · *Cooperative management system · Coopvest Limited*

Management platform for Nigerian cooperative societies: a Go backend serving a Flutter mobile client, instrumented with Firebase Crashlytics and analytics and shipped through the Play Store review process. **Stack:** Go · Flutter · Dart · *private repo*

CMB BVN Verification Portal · *Compliance-team identity verification · Cooperative Mortgage Bank*

Zero-dependency PHP 8 app: no Composer, no Node, no build step, because the target was shared cPanel hosting. Server-side Prembly proxy, bcrypt auth, config above the web root, append-only audit log, and a flock-guarded sliding-window rate limiter that fails closed. **Stack:** PHP 8 · cURL · Prembly IdentityPass · *private repo*

EDUCATION & DEVELOPMENT

BSc Computer Science · Covenant University, Ogun State, Nigeria

2012

Professional development: AWS & Azure cloud fundamentals · SQL and data reporting · secure systems administration
